

National Entrepreneurship Challenge (NEC)

E-Cell, IIT Bombay

Name: Vikramaditya Verma

Team: Titan - Mobility & EV Tech

My Motivation

Being part of our college's student Formula Electric team opened my eyes to the harsh realities of electric mobility in India. During summer testing in Gujarat, our lithium-ion battery pack hit thermal limits within 15 minutes of continuous track runs. Imported battery management systems and off-the-shelf cooling jackets just aren't designed for 45°C ambient temperatures.

That failure sparked my motivation. I don't want to just assemble imported EV kits; I want to design indigenous thermal management solutions tailored specifically for Indian operating conditions. True innovation in mobility requires deep physical engineering, testing under extreme conditions, and the patience to iterate through multiple mechanical revisions.

My Expectations from E-Cell

E-Cell represents a bridge between our lab prototype and actual industrial validation. I expect NEC to connect our team with automotive industry mentors, battery manufacturers, and hardware incubators who understand deep-tech gestation timelines.

I want guidance on patent filings for mechanical designs, navigating ARAI certification processes, and learning how to present hardware unit economics to investors who are accustomed to quick software returns. I'm ready to take critical critique and refine our go-to-market strategy.
