

National Entrepreneurship Challenge (NEC)

E-Cell, IIT Bombay

Name: Harshavardhan Reddy

Team: Titan - Smart Grid & Energy Storage

My Motivation

Working on power grid simulation models during my electrical engineering lab showed me the fragility of localized distribution grids. As rooftop solar installations surge, sudden power fluctuations during peak sunshine hours cause voltage spikes and transformer trips because local grid infrastructure wasn't built for bi-directional power flow.

My motivation is to develop intelligent micro-inverters and battery storage controllers that automatically balance local grid loads in real time. Stabilizing renewable energy integration at the distribution level is critical if India is to hit its clean energy grid targets.

My Expectations from E-Cell

The power sector is tightly regulated by state electricity boards (DISCOMs) and central energy authorities. I expect E-Cell to provide guidance on power sector regulations, pilot approvals with utilities, and deep-tech funding avenues.

I want to use the NEC program to refine our B2B value proposition for commercial building managers, understand how energy hardware startups scale their sales force, and build strong connections with mentors who know energy infrastructure.
