

National Entrepreneurship Challenge - 2026

IIT Bombay E-Cell Submission

Name: Ananya Sharma

Team: Titan - Software & DevTools

My Motivation

Over the past year, I've been maintaining an open-source log monitoring tool on GitHub. Seeing developers from four different countries star the repo and open pull requests was thrilling, but it also exposed a glaring problem: open-source projects often die because engineers don't know how to build a business model around their code. I realized I was spending 20 hours a week resolving GitHub issues for free while server hosting costs were coming out of my own allowance.

That experience shifted my mindset completely. I want to build developer tools that are not just technically elegant, but commercially self-sustaining. Entrepreneurship for me isn't about pitch decks or buzzwords; it's about finding customers who find your software so essential that they are willing to pay a recurring subscription for it.

My Expectations from E-Cell

I am looking to E-Cell for sharp business mentorship on developer-led growth (PLG) and B2B pricing models. In computer science, we learn algorithms and database indexing, but no course teaches you how to structure an enterprise SLA, negotiate early pilot contracts, or calculate Customer Acquisition Cost (CAC).

I expect the NEC program to push me past just writing clean code. I want to learn how to validate developer pain points through structured user interviews, refine our value proposition, and understand how early-stage SaaS ventures transition from open-source utility to venture-backed software companies.
